## Wasabi.player Activation [Mac/Win]

The last time I had a softphone on my desktop was the Skype plugin which was really useful, when I had a Skype account. With it I could make calls from my desktop and see who I was talking to, have video calls, listen to music or play games, all from one place. Well, the days of Skype are over. Skype 2.0 is out and is built to take advantage of Windows

7 and Windows Vista. Now I'll be able to use it just as I did with the Skype plugin back in the days, without installing it on my computer. You don't need a skype account to make and receive calls, and with Skype 2.0 you can receive calls even when you are not online. You can also have video calls which means you can see the person you are talking to on your desktop. And most important, you can use Skype 2.0 like the Skype plugin did, without any need of installing it on your desktop. And in case you were wondering, you still can use it without a webcam, because video calls are still possible. As usual, there are a lot of changes with Skype 2.0. Some are obvious and are just for the better, like the address bar in Skype 2.0 which you can hide and show again using the default address bar, but you can also choose your own address bar, so you can have your Skype address bar and have your website's address bar. Also, the Skype 2.0 menu has been revamped. The system tray icon is

gone, but the menus are also there. But the biggest change in Skype 2.0, are the updated hardware support. Skype 2.0 includes support for all the latest hardware, like integrated webcams, 3D HD video cameras, and more. So, you don't need a new PC to use Skype 2.0. All you need is an internet connection and a webcam. And you don't have to install anything on your computer, just download Skype 2.0 and you are ready to start using Skype. I really like the new Skype 2.0. It has a lot of features and it is much better than the Skype plugin in Winamp. Skype 2.0 has been available for a few days and its development was based on the community feedback. So, you can expect more changes in the future. I'll do a review and keep you updated 2edc1e01e8

It's also possible to configure your video and audio output options directly from Wasabi.player's context menu. Other features include support for some file formats, subtitles and timed subtitles. Wasabi.player is a player designed by a group of independent developers from Nullsoft which have the goal of improving Wasabi. The player takes after Winamp in the sense that its interface layout is that of the popular player while some of the buttons have a different look and some new context menus are added. You get the same main window with controls for playback along with quick access

buttons for the playlist, media library and equalizer. Just like in Winamp, all the windows can be separated and placed independently on screen. From the main window you can view the track title, a band equalizer, adjust volume, as well as toggle shuffle or repeat mode. It's also possible to access the context menu that leads to multiple features and settings. The playlist editor allows you to load single files or entire folders and displays the files in a neat list which you can sort by name, artist, album, path filename, length, track number and reverse order. Files can be played with a simple double click and you can save the loaded tracks as playlists. As far as audio quality goes, it's the same as Winamp's and in case you want to apply some audio enhancements, Wasabi.player provides a 10 band equalizer. It can be toggled to automatically make adjustments as the song plays or you can manually set it up. Presets are also provided by this player and they can be applied with a simple click
