No. 3,757,306 issued to Gary W. Boone and assigned to Texas Instruments. The Boone patent shows a single-chip 8-bit CPU including a parallel ALU, registers for data and addresses, an instruction register and a control decoder, all interconnected using the von Neumann architecture and employing a bidirectional parallel bus for data, address and instructions. U.S. Pat. No. 4,074,351, issued to Gary W. Boone and Michael J. Cochran, assigned to Texas Instruments, shows a single-chip "microcomputer" type device which contains a 4-bit parallel ALU and its control circuitry, with on-chip ROM for program storage and on-chip RAM for data storage, constructed in the Harvard architecture. The term microprocessor usually refers to a device employing external memory for program and data storage, while the term microcomputer refers to a device with on-chip ROM and RAM for program and data storage. In describing the instant invention, the term "microcomputer" will be used to include both types of devices, and the term "microprocessor" will be primarily used to refer to microcomputers without on-chip ROM. Since the terms are often used interchangeably in the art, however, it should be understood that the use of one of the other of these terms in this description should not be considered as restrictive as to the features of this invention.

A: Sorry to be the bearer of bad news, but I don't think it's possible. It's a theme pack. They generally come with some pre-installed set of images as well as a series of configuration files that are used to show those images. These are added via a.msstyles file that applies the theme on top of your theme settings, and the configuration files are added via a.rc file that allows you to tweak the theme. Without these files, you'd basically get the standard Windows theme. I'm not sure if there is a way to activate this, but I do know it's not enabled by default. So there's really no way to have this set up without some sort of extra action to get this going. If you were to try it, and it doesn't work, please tell us what the results were. I recently have been working on my first android game and it has turned into a pain to keep up to date with the latest changes to the android SDK and Google Play Services, as well as the the applications and play services required to compile. For those of you who are aware of this situation, it can be quite frustrating. So I decided to collect the

changes, up to date versions of the applications, the SDK and the Play services, and compile them all into one package so that future developers could just grab this and include all the components required. Right now it is only a download, you will need to use your own Android SDK and Google Play services to compile the game and the compile will fail if you don't have the correct versions. Once the apk is built you can install it to a device or emulator and test it out, let me know if you find any bugs. Thanks for reading. Q: What is the best way to compare dates between two windows servers We have a site built in ASP.NET, SQL Server 2000, but the servers are running Windows Server 2003. We have had this site in use for a couple of years and at one point we didn't have this particular functionality (comparing dates) and it was like a nightmare. We have now been able to add the functionality but I don't know if this is the best way to do it and certainly we want to know if the time is less than a couple of days ago, weeks ago etc. We are currently doing this: Between the server's system dates, (dateTime) I get the difference in seconds Using the difference in seconds, a modified DateTime is calculated with (e.g.) DateAdd(1, -days) Using the modified dateTime, we get the difference in days (e.g. days(modifiedDateTime) - days(now)) The date is returned (e.g. now.ToString("MM/dd/yyyy")) I am open to other suggestions (I know DateTime.AddDays() doesn't really add the number of days and that the way we are doing it isn't really best practice, but we are stuck with the current server and the site works, so we don't really care so much about the best way). A: This would be one way to handle it: TimeSpan difference = DateTime.Today - originalDate; if (
